You need to **seed the random number generator** so it doesn't start from the same point every time.

✅ Add this:

```cpp
#include <ctime>
```

and inside `main()`:

```cpp
srand(time(0));
```

🔧 Example:

```cpp
srand(time(0));   // set seed
int index = rand() % roasts.size();
```

💡 Why this works:

- `time(0)` changes every second
- So each run → different seed → different random numbers → different roast

---

⚠️ Small note:

If you run the program multiple times **within the same second**, you might still get the same output — that's normal.

That's all you need 👍

Write a simple and beginner-friendly C++ console program that generates funny roast messages.

The program should:
- Ask the user to enter their name
- Store at least 10 different roast templates in a vector
- Each template should contain a placeholder {name}
- Randomly select one roast each time the program runs
- Replace {name} with the actual user input
- Display the final roast message

Make sure the code is easy to understand and include basic comments.

Alright, here's a **clean, beginner-friendly version** (like you'd realistically get in convo):

C++

```cpp
#include <iostream>
#include <vector>
#include <cstdlib>
#include <ctime>
using namespace std;

int main() {
    string name;

    // Ask user for name
    cout << "Enter your name: ";
    cin >> name;

    // Store roast templates
    vector<string> roasts = {
        "{name} writes code so slow that even a turtle switched to Python.",
        "If procrastination were an Olympic sport, {name} would win gold.",
        "{name}'s debugging style is staring at the screen until bugs leave.",
        "{name} doesn't debug code — they negotiate with bugs.",
        "{name}'s code has more drama than daily soap,",
        "{name} runs code once and hopes for the best.",
        "{name}'s logic is still loading...",
        "Even Google gets confused by {name}'s code."
```

My program is generating the same roast every time I run it. I am using rand(). Why is this happening?

This happens because `rand()` in C++ is **not truly random by default**.

If you don't set a seed, it always starts from the **same initial value**, so it generates the **same sequence of numbers every time you run the program**.

That's why:

- Same random number
- Same index
- Same roast

💡 In simple terms:

`rand()` = predictable unless you change its starting point

✅ What you need to do

Add this in your code:

```cpp
#include <ctime>
```

and inside `main()`:

```cpp
srand(time(0));
```

🔧 Why this fixes it:

Can you improve the roast templates to make them more creative and funny while keeping them appropriate?

Yeah, we can make them way more fun without getting offensive 😄
Here's a **more creative + natural-sounding set** you can plug in:

```cpp
vector<string> roasts = {
    "{name} writes code so slow that even progress bars lose hope.",
    "{name}'s code has more plot twists than a thriller movie.",
    "{name} doesn't debug — they just wait for the problem to solve itself.",
    "{name}'s logic is like a group project… no one knows who's responsible.",
    "{name} opens the code, stares at it, and closes it like nothing happened.",
    "{name}'s code works by pure coincidence and good luck.",
    "{name} treats error messages like background music.",
    "{name}'s program runs… but only after a long motivational speech.",
    "{name} writes code like a cliffhanger — confusing but interesting.",
    "{name}'s bugs are so loyal, they never leave.",
    "{name} believes 'it works on my machine' is a life philosophy.",
    "{name}'s code has trust issues — it doesn't even trust itself.",
    "{name} spends more time thinking about coding than actually coding.",
    "{name}'s logic sometimes takes unexpected vacations.",
    "{name}'s code compiles… after negotiating with the compiler."
};
```

These are:

- more original
- sound natural (not forced)
- safe for submission
- slightly witty (so prof bhi smile kare 😄)

If you want, I can make them:
👉 more savage
👉 or more "school-safe"

just tell me your teacher ka vibe 😜

3. Selecting the excuse

```cpp
string excuse = excuses[index];
```

- Whatever index comes → that excuse is picked

---

4. Role of `srand(time(0))`

```cpp
srand(time(0));
```

- This sets the **starting point (seed)** for `rand()`
- `time(0)` changes every second → so every run is different

👉 Without this:

- Same sequence → same excuse every time

👉 With this:

- Different sequence → different excuse each run

🔄 Overall flow:

1. User enters name
2. `srand(time(0))` sets randomness
3. `rand()` generates number
4. `% size` → valid index
5. Excuse selected
6. `{name}` replaced
7. Output printed

If you want a short line for viva:

> "rand() generates pseudo-random numbers, and modulo is used to restrict the range to valid indices. srand(time(0)) ensures different outputs on each run."

Clean, simple, done 😄

Can you explain how the random selection works in this program and how rand() is used here?

Yeah, it's the same idea as before, just applied to excuses instead of roasts.

🧠 **How random selection works:**

1. `rand()` generates a number

- `rand()` gives a **pseudo-random integer**
- Example: 41, 872, 19... anything

---

2. Limiting it to valid index

```cpp
int index = rand() % excuses.size();
```

- `excuses.size()` = total number of excuses (say 10)
- `%` makes sure the result is between:

```
0 to 9
```

👉 So it becomes a valid index for the vector

---

3. Selecting the excuse

```cpp
string excuse = excuses[index];
```

- Whatever index comes → that excuse is picked

---

4. Role of `srand(time(0))`

```cpp
srand(time(0));
```

```
    // Store roast templates
    vector<string> roasts = {
        "{name} writes code so slow that even a turtle switched to Python.",
        "If procrastination were an Olympic sport, {name} would win gold.",
        "{name}'s debugging style is staring at the screen until bugs leave.",
        "{name} doesn't debug code — they negotiate with bugs.",
        "{name}'s code has more drama than daily soaps.",
        "{name} runs code once and hopes for the best.",
        "{name}'s logic is still loading...",
        "Even Google gets confused by {name}'s code.",
        "{name}'s code compiles… emotionally.",
        "{name} and bugs are in a long-term relationship."
    };

    // Seed random generator
    srand(time(0));

    // Pick random roast
    int index = rand() % roasts.size();
    string roast = roasts[index];

    // Replace {name} with actual name
    size_t pos = roast.find("{name}");
    while (pos != string::npos) {
        roast.replace(pos, 6, name);
        pos = roast.find("{name}");
    }

    // Print result
    cout << roast << endl;

    return 0;
}
```

This version:

- simple hai
- vector use karta hai
- randomness fix hai
- placeholder properly replace hota hai

Exactly assignment-ready 👍
